

ABSTRACT OF THE DISCLOSURE

Databases store therein CAD drawings which different manufacturers have. Other databases store therein equipment specifications. All the databases are connected to a user terminal via a communication line. Data stored-destination address information is inputted to designate information on the CAD drawing or the equipment specification, from a user terminal, and one of the databases is searched based on the data stored-destination address information, thereby selecting the information on the CAD drawing or the equipment specification is selected from one of the databases, corresponding to the data-stored destination address information, based on the search.
